

Appendix A: Data Collection & Vehicle Classification

Data Collection

- As the LTN was introduced as a response to COVID-19, no comprehensive dataset existed to represent pre-implementation data. Instead, data was drawn from the following studies commissioned by LB Lambeth since 2017:
 - Healthy Routes:** two rounds of data collection to support development of Healthy Cycling Routes (Nov 2019-Mar 2020)
 - 20mph Study:** data collected to underpin analysis on the 20mph Borough-wide speed limit (Jan 2017). The Leigham Vale site used data from the same study in 2015 as this location was impacted by Thames Water repairs during the 2017 study.
 - The Flow:** GPS telemetry data, providing detail on vehicle routing through neighbourhood cells; this data will be used alongside Healthy Routes data for roads where no historic data was collected to approximate vehicle flows
- Of the 14 ATC sites, 2 sites use the Healthy Routes study, 6 sites use the 20mph study and 3 utilise both The Flow data and Healthy Routes. A further 2 sites use data directly from TfL ATCs, and 1 site relies on a Sustrans study from July 2019.

Data Collection

- Through the monitoring programme, data has been collected across the Borough – this has generally been installed in the same locations as those used in a previous study to ensure a fair comparison, although some additional sites have been added, and these will need to make use of The Flow data instead to enable a comparison.
- Almost all new data has been collected via **Automatic Traffic Counters (ATCs)**, which are installations that consist of two pneumatic tubes spanning the width of roads to be surveyed – these capture 15 vehicle classes in both directions based on number of vehicle axles and the distance between axles, and are regularly used across the transport planning profession to capture traffic information. Some sites on the Transport for London Road Network (i.e. “Red Routes”) have had data collected by radar instead.
- Based on the vehicle classifications on the following slide, class 1 & 2 vehicles have been classified as “**car**”, class 3 vehicles have been classed as “**LGV**”, classes 4 to 12 vehicles have been classified as “**HGV**”, class 14 vehicles have been classed as “**motorcycle**” and class 15 vehicles have been classed as “**cycle.**”

Vehicle Classifications

- The table below outlines the **axle-based** vehicle classes as defined by survey companies.

Class		Axles	Groups	Description	Parameters	Dominant Vehicle	Aggregate
1	SV	2	1 OR 2	Short - Car, light Van	$d(1) > 1.7m, d(1) \leq 3.2m$ & axles=2		Light
2	SVT	3, 4 OR 5	3	Short Towing - Trailer, Caravan, Boat, etc.	groups=3, $d(1) > 2.1m, d(1) \leq 3.2m, d(2) > 2.1m$ & axles=3,4,5		
3	TB2	2	2	Two axle truck or Bus	$d(1) > 3.2m$ & axles=2		Medium
4	TB3	3	2	Three axle truck or Bus	axles=3 & groups=2		
5	T4	>3	2	Four axle truck	axles>3 & groups=2		
6	ART3	3	3	Three axle articulated vehicle or Rigid vehicle and trailer	$d(1) > 3.2m, axles=3$ & groups=3		Heavy
7	ART4	4	>2	Four axle articulated vehicle or Rigid vehicle and trailer	$d(2) < 2.1m$ or $d(1) < 2.1m$ or $d(1) > 3.2m$ axles = 4 & groups>2		
8	ART5	5	>2	Five axle articulated vehicle or Rigid vehicle and trailer	$d(2) < 2.1m$ or $d(1) < 2.1m$ or $d(1) > 3.2m$ axles = 5 & groups>2		
9	ART6	>=6	>2	Six (or more) axle articulated vehicle or Rigid vehicle and trailer	axles=6 & groups>2 or axles>6 & groups=3		
10	BD	>6	4	B-Double or Heavy truck and trailer	groups=4 & axles>6		
11	DRT	>6	5	Double road train or Heavy truck and two trailers	groups=5,6 & axles>6		
12	TRT	>6	>6	Triple road train or Heavy truck and three (or more) trailers	groups>6 & axles>6		
14	M/C	2	1 OR 2	Motorcycle	$d(1) > 1.18m, d(1) \leq 1.7m$ & axles=2		Light
15	CYCLE	2	1 OR 2	Cycle	$d(1) < 1.18$ & axles=2		

Vehicle Classifications

- The Automatic Traffic Counters (ATCs) used in this study are considered a reliable, tested method of data collection, and are utilised throughout the transport industry to understand traffic volumes on roads.
- Whilst such counters are generally considered at least 95% accurate in collecting correct traffic data, there is some room for error in vehicle classification (for example tandem cycles being classed as motorbikes given the distance between axles, or scooters being classed as cycles). However, **most** issues occur in the sorting of different types of HGVs into the 9 relevant categories.
- More commonly, vehicles park on or across ATCs, leading to periods where no data is collected. This occurs in pre- and post-implementation data in equal measure, and where such occurrences are likely to have a material impact on analysis results, such missing data has been “patched” or “infilled” using appropriate replacements (*for example, patching blank data 10-11am on a Wednesday with data from 10-11am the day before*). This is a standard practice in the transport industry.

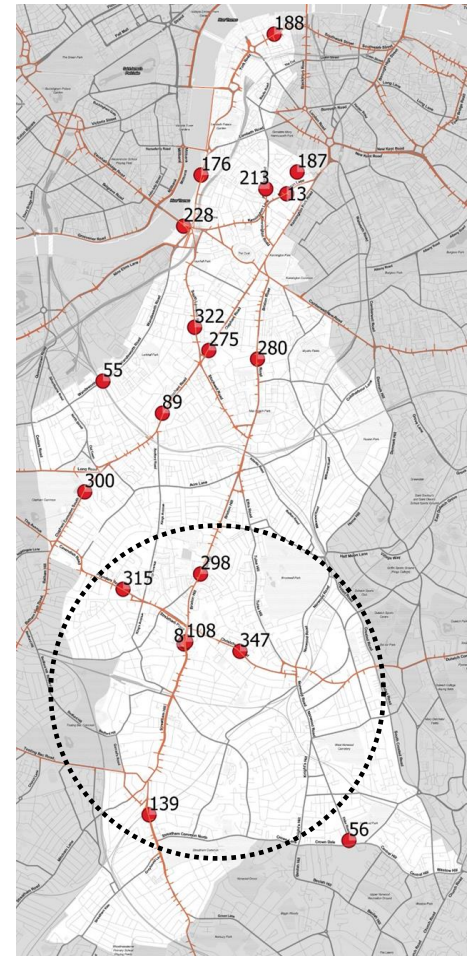

Appendix B: Baseline Calculations

Baseline Calculations (1)

- A “**baselining**” or “**normalisation**” process has been undertaken to approximate a “no-LTN” case for all sites, providing a point of comparison against which recorded “with-LTN” data can be compared.
- Under normal circumstances, this baseline case would have taken flows from before the scheme implementation and compared these (sometimes with a slight adjustment to compensate for population change/employment levels/etc.) to post-implementation flows.
- The nominal (# of vehicles) and percentage changes would *help* indicate, amongst other factors, whether the scheme had achieved its stated goals.
- Given that the LTNs have been part of Lambeth’s emergency response to the Covid-19 pandemic, and that background traffic flows have been very abnormal since March 2020, the aforementioned process could not be followed in such a straightforward manner.

Baseline Calculations (2)

- Instead, to ensure as fair a comparison as possible, flow data from before the LTN was installed (“pre-implementation” data) has been **normalised to June 2021**, when the most recent traffic counts were conducted, representing what would have happened *with* the Covid-19 pandemic, but *without* the LTN.
- The normalisation process uses a “scaling factor” based on the volume of traffic at TfL continuous traffic counters in Lambeth, and within 2km of the LTN’s centre (shown right), for locations where consistent data is available.
- It should be noted that the baseline is a **general** adjustment in terms of **magnitude and direction** of change, rather than an **exact** adjustment.

Baseline Calculations (3)

- The chart to the right shows profiles of traffic flows under various calculation methodologies: ATC counters in all of Lambeth, within 2km of the Streatham Hill LTN and at an ATC adjacent to the LTN on Brixton Road
- As a balance between representing local flows and ensuring erroneous traffic events (accidents/construction) do not unduly impact normalisation, the **Streatham Hill +2km approach** has been utilised in this report, which leads to more conservative results (i.e. understating reductions in cars/HGVs/LGVs) than does the Borough average.

Baseline Calculations (4)

- The “scaling factor” used for this normalisation **differs by site**, as pre-implementation data was drawn from a variety of different studies occurring between 2017 and early 2020.
- Because traffic has typically been lower than pre-Covid throughout 2020-2021, normalising data represents a conservative approach to analysis, and would tend to underestimate reductions in vehicle numbers.
- The below example shows how the scaling factor is calculated and applied to flows for Palace Road:

$$\frac{\text{TfL ATC traffic flow: June 24-30, 2021}}{\text{TfL ATC traffic flow: December 4-10, 2019}} = \frac{1,062,541}{1,091,684} = 97.3\% \quad \longrightarrow \quad \text{June '21 flows are 97.3\% of December '19 flows}$$

$$\frac{\text{Palace Road flows: June 2021}}{(\text{Palace Road flows: December 2019}) * (\text{Scaling Factor})} - 1 = \frac{3,211}{2,160 * 97.3\%} - 1 = \frac{3,211}{2,102} - 1 = 1.53 - 1 = +53\%$$

↓
53% increase in car flows

Streatham Hill (Daily Flows)

- The chart below shows the normalised **average daily flows on Streatham Hill**, showing the difference between pre- and post-implementation flows. Hour-by-hour data is not available for this site.
- This site at Streatham Hill uses data directly from a TfL continuous ATC, which provides daily motor vehicles totals. To determine the impact of the scheme on this site, a comparison has been made between what flows **would have been** at this site if it had followed the trend of other ATCs within 2km of the LTN, and what flows actually were.
- TfL ATCs do not break down traffic by vehicle class. Similarly, hour-by-hour data is not available for this site.

Streatham Hill - Summary Table

	Jul-20: Actual Average	LTN +2km ATC Projected	Post-Implementation Actual Average	Jul-20 vs. Post- Implementation Actual Average, Difference	Projected vs. Actual Average, Difference	June-20 vs. Post- Implementation Actual Averages, % Difference	Projected vs. Actual Average, % Difference
Total Motorised Vehicles	18,325	17,198	17,654	-1,843	455	-4%	+3%

Christchurch Road (Daily Flows)

- The chart below shows the normalised **average daily flows on Christchurch Road**, showing the difference between pre- and post-implementation flows. Hour-by-hour data is not available for this site.
- This site at Christchurch Road uses data directly from a TfL continuous ATC, which provides daily motor vehicles totals. To determine the impact of the scheme on this site, a comparison has been made between what flows **would have been** at this site if it had followed the **trend at the ATC about 1 mile further west on the South Circular at Clarence Avenue** (given abnormally high flows across the entirety of the South Circular as it passes through Lambeth)
- TfL ATCs do not break down traffic by vehicle class. Similarly, hour-by-hour data is not available for this site.

Christchurch Road - Summary Table

	Jul-20: Actual Average	Projected based on Clarence Ave ATC.	Post-Implementation Actual Average	Jul-20 vs. Post-Implementation Actual Averages, Difference	Projected vs. Actual Average, Difference	June-20 vs. Post-Implementation Actual Averages, % Difference	Projected vs. Actual Average, % Difference
Total Motorised Vehicles	25,743	24,464	27,718	1,975	3,254	+7%	+13%

- As Christchurch Road lies between two LTNs (Tulse Hill and Streatham Hill), the overall impact to traffic has been evenly split across both LTNs when presented in the executive summary – this means that the total impact to summed Streatham Hill vehicle counts is **+1,627**.

Appendix D: Additional Site

Knolly's Road (Daily Flows)

- The site on Knolly's Road was monitored in June 2021 only based on resident feedback. However, given its distance from Streatham Hill, has not been included in calculations for LTN scheme.
- The charts below and on the following pages show the normalised **average daily flows on Knolly's Road**, showing the difference between pre-implementation flows collected in January 2017 and post-implementation flows from June 2021.
